

Deterministic reference vs. live model

One 12-case, 13-finding suite; two independently labeled runs. Scores are never averaged or blended.

Design boundary: The Python engine (fintrace/) is the authoritative implementation. The public Next.js page presents a versioned fictional fixture for demo reliability and does not execute the pipeline live in the browser. This is an intentional design choice, not a limitation of the workflow — full live execution is available via `python -m fintrace demo --provider live`.

DETERMINISTIC REFERENCE	LIVE MODEL: llama-3.3-70b-versatile
13 / 13 correct 100.0% classification accuracy	13 / 13 correct 100.0% classification accuracy
Reproducible local baseline	Temperature 0.0 Run 2026-08-10T07:40:53.217587+00:00

Scope: Results are limited to this controlled fictional benchmark and are not a claim of general model performance. Disagreements remain visible case by case.

Independent measured results

Run	Correct	Accuracy	False positives	Unsupported	Numeric
Deterministic reference	13/13	100.0%	0 (0.0%)	0 (0.0%)	13/13
Live: llama-3.3-70b-versatile	13/13	100.0%	0 (0.0%)	0 (0.0%)	13/13

Same formulas and 13-finding denominator for both runs. Deterministic integrity: PASSED. Live integrity: PASSED.
